01

# Project Statement

# A Developer's Journal

The day to day work of developers tends to be decentralized, with many different aspects of their work being hosted on a variety of platforms.

With this in mind, we wish to centralize the ecosystem of essential tools into one journalistique structure to streamline the development experience.

02

# User Stories

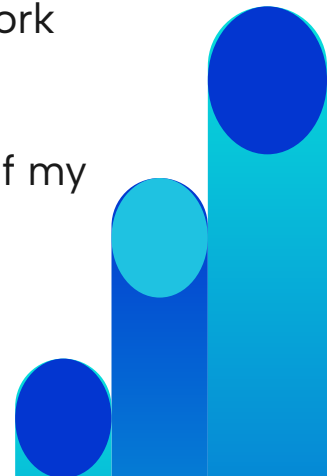

# The Developer Stories

As a **developer** using the product for personal purposes, I want to be able to implement a top-down approach to my work, breaking down large tasks into smaller ones to see the incremental progress that I make.

As a **developer** for a technology company, I want to keep track of my work accomplishments in a secure fashion in order to ensure confidential company information does not get leaked so that I can still keep track of my accomplishments for promotion purposes.

# The Computer Science Major

As a **college student** majoring in Computer Science, I want to keep records of each course I took, each project I participated in, and each internship experience, so that I'm clear about what are my skills and strengths and will be prepared for job interviews.

Additionally, I want to be able to track my technical growth by looking at past projects and quality.

Finally, I want a shareable page to show off my greatest achievements as a student developer based on completed projects.

# The Project Manager

As a **project manager** of a software engineering team, I want to keep up with the progress on various tasks of my team members so that I can get a sense for the timeline of our project and any adjustments that need to be made to speed up work in various categories.

With the developer journal, I am able to tackle this issue through organizing all things that I need to keep track of in one nice location!

03

# System Design

.....

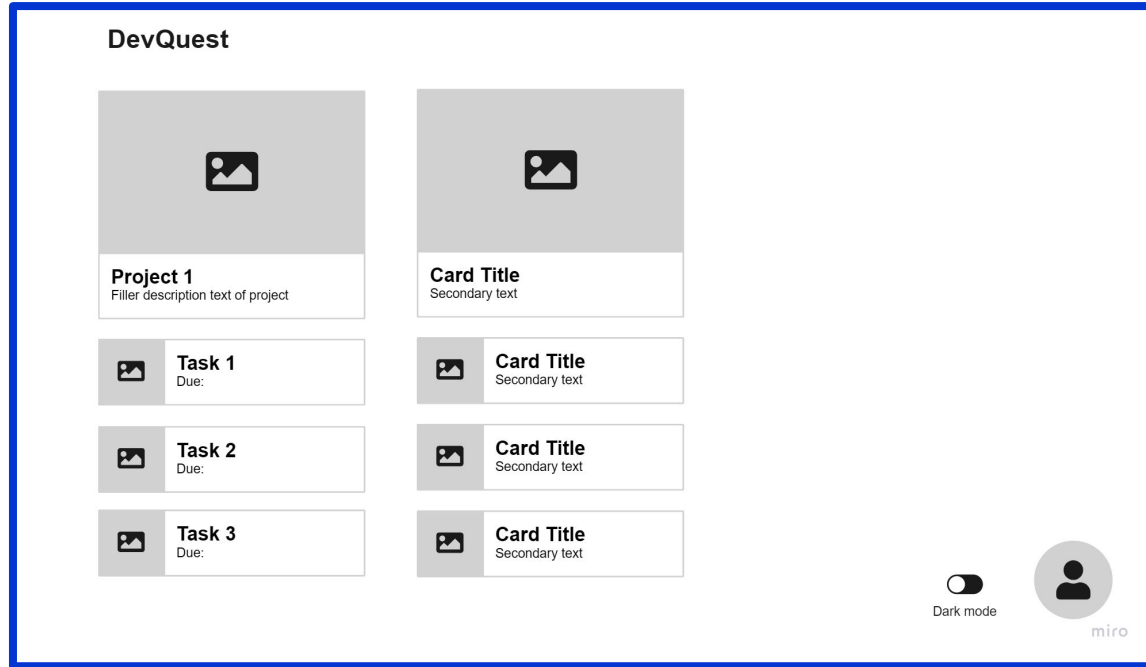

# Features

- Clean organization of upcoming tasks required to complete a project
  - Journaling tool to review daily work contributed towards a project
  - Calendar showcasing task due dates for a clear timeline of priorities
  - Developer tools such as syntax validators and preview software to visualize development
- 
- 

# Wireframe

04

# Risks & Rabbit Holes

.....

# Risks

- Inter-dependencies
    - Deadlines are dependent on calendar, calendar dependent on dates
    - Project management & collaboration between users dependent on  
account login system
  - Time constraints
- 
- 

# Rabbit Holes

- GitHub Integration
  - Code Preview/running (like LiveServer)
  - Code validation/style checker (W3, Linter)
  - Account System (User Logins/Sync)
- 
-
